SOCIAL SKILLS TRAINING

Research does not support the “social skills training” services model that many schools and clinics are currently providing for Autistic children: Camouflaging and masking typical Autistic traits (forced eye contact, social scripting, behavior and social skills compliance training is harmful and can lead to depression, anxiety, lowered self-esteem and suicidal ideation.
Perspective Taking and Acceptance Education are what is needed:
Autism: A Resource for Professionals & Parents

Neurotypical Peers are Less Willing to Interact with Those with Autism based on Thin Slice Judgments
Teaching perspective taking and peer acceptance is vital.

WHY EYE CONTACT THERAPY GOALS ARE ARCHAIC

A Few Countries Where Eye-Contact is not always considered part of Cultural Norms:
- China
- Japan
- Iran (gender interactional related)
- Vietnam (gender interactional related)
- Cambodia
- Indonesia (disrespectful to elders)
- Kenya (disrespectful to elders or higher status)
- Hong Kong
- South Korea
- Thailand
- Australia (sometimes)
- Canada (sometimes)
- Saudi Arabia (gender interactional related)

Why do those with autism avoid eye contact? Imaging studies reveal overactivation of subcortical brain structures in response to direct gaze
Individuals with autism spectrum disorder often find it difficult to look others in the eyes as they find eye contact uncomfortable or stressful. Now a study has shed light on the brain
mechanisms involved in this behavior.

June 15, 2017 - Massachusetts General Hospital
https://www.sciencedaily.com/releases/2017/06/170615213252.htm

Look me in the eyes: constraining gaze in the eye-region provokes abnormally high subcortical activation in autism

We computed differences in activation in the subcortical face processing system (superior colliculus, pulvinar nucleus of the thalamus and amygdala) for the same stimuli seen freely or with the gaze constrained in the eye-region. Our results show that when constrained to look in the eyes, individuals with ASD show abnormally high activation in the subcortical system, which may be at the basis of their eye avoidance in daily life.

Unconscious avoidance of eye contact in autism spectrum disorder

…the ASD group had no such preference towards direct gaze and instead showed a tendency to prefer the face with averted gaze, suggesting an unconscious avoidance of eye contact. These results provide the first evidence that the atypical response to eye contact in ASD is an unconscious and involuntary response.

Madipakkam AR, Rothkirch M, Dziobek I, Sterzer P. Unconscious avoidance of eye contact in autism spectrum disorder. Psychology, MedicinePublished in Scientific Reports 2017 DOI:10.1038/s41598-017-13945-5

Gaze fixation and the neural circuitry of face processing in autism

In addition, variation in eye fixation within autistic individuals was strongly and positively associated with amygdala activation across both studies, suggesting a heightened emotional response associated with gaze fixation in autism.

Why Eye Contact Is So Distressing For People With Autism

Article in layman’s terms: The study published in June in Scientific Reports reveals that people with autism spectrum disorder avoid eye contact because it causes anxiety, and not as an unintentional demonstration of lack of empathy. Not only does this validate what people with autism have been saying for years, it also suggests we’ve been applying wrong ideas to therapeutic intervention for kids with autism.

NEGATIVE OUTCOMES OF MASKING AUTISM

The Female Autism Phenotype and Camouflaging: a Narrative Review

Camouflaging refers to the use of conscious or unconscious strategies, which may be explicitly learned or implicitly developed, to minimize the appearance of autistic characteristics during a social setting. Examples include... forcing oneself to make eye contact and to stop talking about an interest. ...may lead to negative outcomes or perpetuate an expectation of adaptation to
Autism: A Resource for Professionals & Parents

others’ expectations which reduces autistic individuals’ self-esteem
https://doi.org/10.1007/s40489-020-00197-9

Autistic traits in adults who have attempted suicide
“There are several reasons why elevated autistic traits may be associated with suicidal thoughts and behaviour in people with or without a diagnosis of autism... camouflaging’ of autistic characteristics to fit in in social situations”
https://doi.org/10.1186/s13229-019-0274-4

Understanding the Reasons, Contexts and Costs of Camouflaging for Autistic Adults
Camouflaging entails ‘masking’ in or ‘passing’ social situations. Research suggests camouflaging behaviours are common in autistic people, and may negatively impact mental health including higher rates of anxiety and depression, identity confusion.
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6483965/

Compensatory strategies below the behavioural surface in autism: a qualitative study
The findings suggested that there are multiple compensatory strategies with distinct characteristics, individual and environmental factors that modulate compensatory strategy use and success, positive (social relationships, independence, employment) and negative (poor mental health, late diagnosis) outcomes associated with compensatory strategy use.
The Lancet Psychiatry - VOLUME 6, ISSUE 9, P766-777, SEPTEMBER 01, 2019
https://doi.org/10.1016/S2215-0366(19)30224-X

Risk markers for suicidality in autistic adults
Results A majority of autistic adults (72%) scored above the recommended psychiatric cut-off for suicide risk on the SBQ-R; significantly higher than general population (GP) adults (33%). After statistically controlling for a range of demographics and diagnoses, ASC diagnosis and self-reported autistic traits in the general population significantly predicted suicidality. In autistic adults, non-suicidal self-injury, camouflaging, and number of unmet support needs significantly predicted suicidality.

Experiences of Autism Acceptance and Mental Health in Autistic Adults
... showed that autism acceptance from external sources and personal acceptance significantly predicted depression. Further analyses suggested that experiences of “camouflaging” could relate to higher rates of depression.

Suicidal ideation and suicide plans or attempts in adults with Asperger's syndrome attending a specialist diagnostic clinic: a clinical cohort study.

Extremely high prevalence of suicidal ideation (66%) amongst individuals attending an adult ASD clinic, which substantially exceeds estimated figures amongst adults diagnosed in childhood or adolescence.

On Masking Autism - For Further Reading

Social camouflaging in autism: Is it time to lose the mask?
For many autistic people, camouflaging is experienced as an obligation, rather than a choice. It is often motivated by a sense of alienation and threat, and frequently represents an attempt to avoid ostracism and attacks. Such findings offer a vivid reminder of the daily challenges autistic people face: they show us the pervasive difficulties of being autistic in a world that is shaped by the non-autistic majority. In qualitative research, autistic people consistently link their camouflaging to experiences of anxiety and depression. One study found that self-reported camouflaging is associated with higher rates of suicidality

Conceputalising compensation in neurodevelopmental disorders: Reflections from autism spectrum disorder.
Individuals diagnosed with ASD in childhood who go on to achieve ‘good outcome’ have been described as showing remarkable compensation. We do note, however, that the majority of studies into adult outcome thus far rely heavily on definitions of outcome imposed by neurotypicals to neurotypical standards, and may not necessarily reflect the best outcomes as perceived by autistic individuals themselves. These studies to date consider ‘good outcome’ to
Autism: A Resource for Professionals & Parents

have occurred, when autistic individuals appear, at least on the surface, to be experiencing a less impairing version of the condition. For example, an individual may be taught to make eye contact without necessarily being able to extract mental state information from that eye contact. ...the task of ‘pretending to be normal’ during social interaction is mentally tiring and stressful.

The Art of Stimming: ABA Has Left a Legacy of Traumatized Kids
...but the concept of trying to erase ‘autistic’ behaviors remains enshrined in too much parenting and therapeutic doctrine. Today, ABA [Applied Behavioral Analysis] therapy typically relies on withholding positive reinforcement until a child stops stimming, makes eye contact, or otherwise performs as desired. ‘The stated goal of the founder of ABA was to render autistic children “indistinguishable from [their] peers,”’ she writes. ‘Not to support autistic kids, help us learn and grow and become happy and self-determined adults, but to remove all visible signs of autism.’
https://www.madinamerica.com/2018/12/art-stimming-aba-legacy-traumatized-kids/?fbclid=IwAR3TYA4mOSVlr_R-4T3XxqTo_n02AmhDSJhRG5YpQmOc4OOkKhKq4csYNa

SENSORY PROCESSING DISORDER

The Importance of Sensory Processing in Mental Health: A Proposed Addition to the Research Domain Criteria (RDoC) and Suggestions for RDoC 2.0
“We identify two missing classes of sensory symptoms that we widely define as (1) sensory processing, including sensory sensitivity and active sensing, and (2) domains of perceptual signaling, including interoception and proprioception, which are currently absent or underdeveloped in the perception construct of the cognitive systems domain.”

New research reveals that some autistic children (and even autistic adults) cannot learn to self-regulate when overwhelmed with sensory input, and instead, should be supported with both reduced exposure, and with provided supports such as noise canceling headphones to avoid the sensory overload altogether, rather than physically having to tolerate the sensory exposure. (July 29, 2019) “The findings suggest that these autistic children would not benefit from ‘exposure therapy,’ in which a therapist gradually exposes a person to increasing levels of a troublesome stimulus.”

‘Today, sensitivity to loud noise is just a nuisance for me. Unfortunately, there are some individuals who are never able to do normal activities such as going on a train or shopping in a crowded, noisy supermarket. For example, a study published earlier this year showed that sensory-related behavior limits participation in work, family and leisure activities. There are some reactions to sensory overstimulation that could be confused with social
Autism: A Resource for Professionals & Parents

deficits (lack of social skills). Some individuals react to sensory overload by screaming, but others may withdraw.” - Temple Grandin
https://www.spectrumnews.org/opinion/viewpoint/treatments-needed-for-severe-sensory-sensitivity/

Understanding Sensory Processing Disorder – STAR Institute
“Sensory Processing Disorder or SPD (originally called Sensory Integration Dysfunction) is a neurological disorder in which the sensory information that the individual perceives results in abnormal responses.”
https://www.spdstar.org/basic/understanding-sensory-processing-disorder

PROPRIOCEPTION SYSTEM

The proprioception system senses the position, location, orientation, and movement of the body muscles and joints. Proprioception provides us with the sense of the relative position of neighboring parts of the body and effort used to move body parts. If it’s in dysregulation, the person does not feel connected to their body.

Dysregulation in proprioception may look like:
- Licking (walls, toys), mouthing objects, eating play-dough or other non-edible items
- Lack of physical boundaries with peers and adults (touching, hugging, kissing, standing too close, breathing on others)
- Running hands on walls while walking
- Falling to floor when overwhelmed, frightened or when experiencing trauma – “grounding”

The Intense World Theory – a unifying theory of the neurobiology of autism
Frontiers in Human Neuroscience, 21 December 2010
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3010743/

INTEROCEPTION
Interoception refers to sensations related to the physiological/physical condition of the body. Interoceptors are internal sensors that provide a sense of what our internal organs are feeling. The ability to adequately sense the physical feelings of hunger, thirst, and the need to urinate are examples of proper interoception function.

Interoception is Impaired in Children, But Not Adults, with Autism Spectrum Disorder

APPLIED BEHAVIORAL ANALYSIS (ABA)

2019 Department of Defense – “ABA’s effectiveness is unproven”:
On October 25, 2019, the Department of Defense reported to Congress regarding TRICARE, and the effectiveness of ABA treatment for Autism. Based on data outcome measures, 76% of those receiving ABA treatment had no change in symptoms, and 9% WORSENED by more than a full standard deviation. This data reaffirms the November 2018 assertion by Navy Captain Edward Simmer, Chief Clinical Officer of the Tricare Health Plan, that the effectiveness of applied behavioral analysis for autism remains unproven.

Autism and Behaviorism - New Research Adds to an Already Compelling Case Against ABA

Autism: A Resource for Professionals & Parents

WHY CAREGIVERS DISCONTINUE APPLIED BEHAVIOR ANALYSIS (ABA) AND CHOOSE COMMUNICATION-BASED AUTISM INTERVENTIONS

How much compliance is too much compliance: Is long-term ABA therapy abuse?

Evidence of increased PTSD symptoms in autistics exposed to applied behavior analysis

Should we change targets and methods of early intervention in autism, in favor of a strengths-based education?

Treating self-injurious behaviors in autism spectrum disorder
“Self-injurious behavior is a cry for help.” “ABA therapists use an FBA to look at both the antecedent and the consequence of SIBs in order to hypothesize the function of SIBs. It is unclear why one would assume such an assessment/analysis would also be appropriate to assess the thoughts, feelings, and other internal processes that often determine the function of self-injurious behaviors (especially since we know this is the case for SIBs in the non-autistic population). Instead of approaching these SIBs and understanding them the way we understand SIBs in other populations, we have misapplied an FBA in an attempt to measure SIBs despite the fact that it cannot measure such a construct. This makes the assessment unscientific and methodologically flawed.”

Training by repetition actually prevents learning for those with autism
“It’s like they showed ‘hyperspecificity’ of learning — their learning became fixed and inflexible — since learning the first location adversely influenced their ability to learn the second instance,” said Hila Harris, the study’s lead author from the Weizmann Institute.

At The Expense of Joy: Human Rights Violations Against Human Beings With Autism via Applied Behavioral Analysis
In discussing the basis for his treatment, Lovaas wrote of Human Beings with Autism in 1974, ‘You see- you pretty much start from scratch when you work with the Autistic child. You have a person in the physical sense—they have hair, a nose and a mouth—but they are not people in the psychological sense. One way to look at the job of helping Autistic kids is to see it as a matter of constructing a person. You have the raw materials and you have to build a person’
Autism: A Resource for Professionals & Parents

(Rekers & Lovaas, 1974). Lovaas, in borrowing the principles from his earlier torture of gay children, began to impose similar strictures on children with Autism, a population which many would argue have an even greater vulnerability.

Upload Your Own Pictures. 500+ templates. Pre-made board share access.
https://lessonpix.com/

AAC is not just for non-speaking children: AAC can be essential during a crisis (Meltdown, trauma, unexpected event or transition)

**ACCESSSABLE AAC BILL OF RIGHTS**
https://drive.google.com/file/d/0B2EtLwlnPKiWc2JaeVhQWGx0d0E/view

There are NO prerequisites to AAC
ASHA: “Prerequisite skills such as understanding of cause and effect and showing communicative intent must be demonstrated before AAC should be considered; individuals with cognitive deficits are not able to learn to use AAC.

Research Findings
Measures of pre-communicative cognitive ability may be invalid for some populations, and research suggests that impaired cognition does not preclude communication (Kangas & Lloyd, 1988; Zangari & Kangas, 1997). Development of language skills can lead to functional cognitive gains (Goossens’, 1989).

AAC intervention for children with complex communication needs helps develop functional communication skills, promotes cognitive development, provides a foundation for literacy development, and improves social communication (Drager et al., 2010).”

Access” means having the freedom or ability to have unrestricted use of something. For someone who is dependent on AAC for communication, having continuous AAC access is a human right. National Joint Committee for the Communication Needs of Persons With Severe Disabilities (NJC) position on Access to Communication Services and Supports: Concerns Regarding the Application of Restrictive “Eligibility” Policies.

**WHY IDENTITY FIRST LANGUAGE:**
“In the autism community, many self-advocates and their allies prefer terminology such as “Autistic,” “Autistic person,” or “Autistic individual” because we understand autism as an inherent part of an individual's identity — the same way one refers to “Muslims,” “African-Americans,” “Lesbian/Gay/Bisexual/Transgender/Queer,” “Chinese,” “gifted,” “athletic,” or “Jewish.”
Autism: A Resource for Professionals & Parents

On the other hand, many parents of Autistic people and professionals who work with Autistic people prefer terminology such as “person with autism,” “people with autism,” or “individual with ASD” because they do not consider autism to be part of an individual’s identity and do not want their children to be identified or referred to as “Autistic.” They want “person-first language,” that puts “person” before any identifier such as “autism,” in order to emphasize the humanity of their children.
